

Chamber for food products storage in cold or hot state ' - has enclosing walls which are telescopic in one direction

TARASOV P A 94.02.11 94RU-005065

(97.06.10) F25D 11/00, 13/00

The chamber has an insulating body connected to cooling or heating units. The body walls which enclose the chamber in one direction are telescopic. The extending and stationary sections of the telescopic walls are hollow so additional thermal insulation can be used. The additional thermal insulation sheets are divided into separate strips or elements in the direction perpendicular to the direction of the extending telescopic sections.

The volume can be increased by removing the upper chamber door and removing the cladding lids. The inner extending sections of the upper chamber are extended manually. Additional thermal insulation sheets are located inside the outer extending sections. The lids are replaced and the door replaced.

USE - For food storage at various temps.

ADVANTAGE - The volume of the chamber can be changed. (8pp Dwg.No.1,4/5)
